| <b>PCOS Early Risk Prediction System</b><br><i>Python, Scikit-learn, FastAPI, Pandas, SMOTE</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | ML + API  |
| <ul style="list-style-type: none"><li>• Designed and developed the complete machine learning pipeline for early PCOS risk prediction using Gradient Boosting, achieving ROC-AUC of 0.96 and 97% recall</li><li>• Collected, merged, and preprocessed multi-source datasets (3500+ records) and engineered interaction-based features</li><li>• Evaluated multiple models (Logistic Regression, Random Forest, Gradient Boosting) and implemented a dual-model architecture with SMOTE for improved generalization</li><li>• Developed a FastAPI-based backend for serving real-time predictions</li><li>• Collaborated on integrating the ML backend with a Flutter-based mobile application</li></ul> |           |
| <b>AI Scam Honeypot System</b><br><i>Python, FastAPI, Regex</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | AI System |
| <ul style="list-style-type: none"><li>• Built a honeypot system to detect and engage scam messages using multi-signal analysis</li><li>• Implemented keyword-based detection and extracted UPI IDs, URLs, and phone numbers</li><li>• Designed session-based multi-turn interaction and risk tracking mechanism</li></ul>                                                                                                                                                                                                                                                                                                                                                                              |           |

## Technical Skills

---

**Languages:** C, C++, Java, Python  
**Machine Learning:** Pandas, NumPy, Scikit-learn  
**Backend:** FastAPI, REST APIs  
**Database:** MySQL, MongoDB  
**Core:** Machine Learning, Data Structures and Algorithms, DBMS, Operating Systems, Computer Networks  
**Tools:** Git, GitHub

## Certifications

---

- Mastering Data Structures and Algorithms using C/C++ – Abdul Bari (76 hours)
- The Ultimate MySQL Bootcamp – Colt Steele
